To start the software there are a few options described bellow.

Database

1. First option is to use our remote database that the software is connected to. In case of not working or wanting otherwise follow the next step.
2. Follow the steps:

   - To create the database the **database_creation.sql** is included in **Appendix Q User and Installation Guide**. Run the script (that creates the schema/tables and populates the tables with basic information) from any query tool;
   - Change the **DatabaseConnection** class located in the **src->server->dataprovider->DatabaseConnection** and change the variables (String) **url, user, pw** in the constructor **DatabaseConnection()** of the class with your own information;

External Libraries

Add the libraries included in the **Appendix K Source Code -> External Libraries;**

Starting the software

1. Run the main server located in the **src->server->ServerStarter;**
2. Run the client class located in **src->client->launcher->RunAlt;**

Software

You can register your own accounts or use a few dummy accounts that are provided:

Teacher:

   - Account name/number: ***john0001***
   - Password: ***password***

Students:

   - Account name/number: ***james0001***
   - Password: ***password***
   - Account name/number: ***alison0001***
   - Password: ***password***
